No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                              1 APPVAGPSVFLFPPKPKDTL......CKVSNKGLPAPIEKTISKTK 109

                                                                      The sequences given in AAR41707-09 are encoded by the expression vector pAH4625. This vector represents the cloning of the human gamma isotype, gamma-2, with the variable region of the murine monoclonal artibody 128.1. This plasmid encodes a chimeric monoclonal antibody in which the heavy chain (VH) is derived from a murine source and the sequences encoding CHL, CH2 and CH3 are derived from a human source. This vector, in combination with the chimeric light chain vector, pAG4611 (see also AAQ43845), was transfected into SP2/0 cells and clones were isolated. 128.1 is an anti-human transferrin receptor antibody which binds to the transferrin receptor on brain capillary endothelial cells. This antibody may be used in a conjugate in which it is linked to a neuropharmaceutical or diagnostic agent. The conjugate may be used to treat or prevent neurological disorders eg. brain tumours, AIDS, stroke, epilepsy, Parkinsons and Alzheimers disease. It may capillary endotheds.
                                                                                                                                                                                                                                                                                                                                                    ó

AAB07474-78 represent native IgG Fc regions. The proteins are used to produce Fc region-containing polypeptides that have altered effector function as a consequence of one or more amino acid modifications in the Fc region. The variant polypeptides are useful for treating cancer, altergic conditions such as asthma (with an anti-19E antibody), and LFA-1-mediated disorders. Where the polypeptide binds the HER2 receptor, the disorders where the polypeptide binds the HER2 benign or malignant tumour characterized by overexpression of the HER2 receptor. Such cancers include breast cancer, squamous cell cancer, small-cell lung cancer, non-small cell lung cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel fusion polypeptides comprising a peptide ligand domain which functions to target hybrid molecule to target cell, and immunoglobulin constant region multimerization domain
                                                                                                                                                                                                                                                                                                                                                                                                                                              gastrointestinal cancer, pancreatic cancer, glioblastoma, cervical cancer, ovarian cancer, bladder cancer, hepatoma, colon cancer, colorectal cancer endometrial carcinoma, salivary gland carcinoma, kidney cancer, lurar cancer, prostate cancer, vulval cancer, thyroid cancer, hepatic carcinoma and various types of head and neck cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a fusion protein, comprising a peptide ligand and an immunoglobulin (Ig) constant region multimerization domain (Ib). The hybrid molecules comprising the peptide ligands and their functional derivatives can be used in the same applications as, a peptide ligand can be used. For example the peptide ligand can bind ErbB2. The peptide ligand
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Fusion protein; immunoglobulin; multidimerization domain; ligand

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention relates to non-naturally occurring peptide ligands which bind to the human erbB2 gene product ErbB2 (also known as HER2). Peptides represented in AAB76350 - AAB76420 and AAB76532 - AAB76509 are examples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    of the ErbB2 binding ligands of the invention. Sequences AAB76421 - AAB76431 represent antibody Fc amino acid sequences used in the isolation of the peptides of the invention. The peptides compete for binding ErbB2 with naturally occurring ligands, and may be used to treat disorders characterized by over expression of HER2/ErbB2 such as cancers, diseases of the nervous system, musculature and epithelia, e.g. nervous system damage resulting from trauma, surgapry, strokes, ischaemia, infection, metabolic disorders, nutritional deficiency or toxic agents. In particular the synthetic peptide ligands may be used to treat Alzheimer's disease, parkinson's disease, epilepsy, multiple sclerosis, Huntington's chorea, Down's syndrome, nerve deafness, Meniere's disease and neuropathy associated with diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Non-naturally occurring peptide ligands which compete for binding human erB2 gene products, useful for treating e.g. Alzheimer's disease, multiple sclerosis and diabetic neuropathy -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; erbB2; HER2; cancer; nervous system disease; stroke; ischaemia; metabolic disorder; nutritional deficiency; Alzheimer's disease; Parkinson's disease; epilepsy; multiple sclerosis; Huntington's chorea; Down's syndrome; nerve deafness; Meniere's disease; diabetic neuropathy

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       containing EPO are useful in the treatment of EPO deficient diseases such as anaemia, renal failure, HIV infection, blood loss and chronic disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     portion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is human immunoglobulin G2 (IgG2) constant region mature protein. IgG2 forms a fusion protein with human erythropoietin (EPO). EPO has improved biological activity and an extended serum half life greater than 20 hours. The present invention relates to modified EPO forms such as fusion proteins comprising a Fc portion of an immunoglobulin (Ig) molecule and an EPO molecule (Fc-EPO). The Fc portion is fused covalently through its C-terminus directly or indirectly to the EPO molecule, and where the Fc portion as well as EPO portion may be modified or mutated. The invention also relates to non-lised EPO molecules which have a pattern of cysteines or disulphide bonding which is distinct from human or animal EPO. Pharmaceutical compositions

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to vaccine compositions comprising a vaccine and a timed-release formulation of a cytokine or cytokine/immunoglobulin fusion protein or plasmid. The formulation or device releases the cytokine protein or plasmid at one or more temporal points subsequent to vaccine administration. The vaccines can be used for treating an autoimmune disease, an inflammatory disease, a neoplastic disease, or an immunologic disease in an inflammatory disease, an immunologic disease in an individual. The vaccines can be used to elicit immune responses against diseases such as AIDS, malaria, tuberculosis, hepatitis C, hepatitis B, cancer or influence. The methods can provide for enhancement of one or more immunologic parameters such as an antibody response, a cellular proliferative response as well as cytotoxic T-lymphocyte levels. In addition the Ig can increase the circulating half life of the cytokine. The present sequence represents a human interleukin-2 (IL-2)/Ig fusion protein.
                                                                                                                                                                                                                  Fusion protein; vaccine; cytokine; immunoglobulin; autoimmune disease; infectious disease; inflammatory disease; neoplastic disease; cancer; immunologic disease; immune response; malaria; tuberculosis; hepatitis; AIDS; influenza; interleukin; IL-2; Ig; human.

It was produced by expresion of the coding mutagenised cobnergiate as described in AAQ28088) in Dhfr-CHO cells. The protein is efficiently assembled intracellularly and effectively secreted from mammalian cells pref. CHO, COS, or myeloma cells as a homodimer, enabling high recovery and purification from the medium of cells expressing it. It possesses increased serum half-life and has increased avidity for HIV cf. heavy chain dimers. It can inhibit HIV infection of Attachment to a detectable marker makes it useful in an assay for HIV or SIV infection, and it can also be linked to toxins, eg Diphtheria, Pseudomonas exotoxin A (domainS I or II) or the deglycosylated A-chain
This sequence represents a CD4-gamma2 chimeric heavy chain homodimer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              homodimer; soluble CD4; T cell receptor; CD4 antigen; high recovery; chimeric; increased serum half life; HIV infection; AIDS; ss.

                                                                                                                                                                                                       g
    ö
                                                                         peptidyl toxin or a gamma radiation-emitting radionuclide of low to moderate cytotoxicity. The resulting immunoconjugate comprising the toxin can be used to kill HIV infected cells and to treat HIV infected cells and to treat HIV infected subjects to reduce the population of HIV infected cells. It can also be used to reduce the likelihood of infection. The immunoconjugate comprising the radionuclide can be used to image HIV infected tissue, to calculate the stage of HIV infection or the efficacy of an anti-HIV treatment using the imaging technique and for determining the prognosis of an HIV infected subject.

The invention relates to an immunoconjugate comprising a cytotoxic radionuclide and a heterotetramer of two heavy chains and two light chains. The cytotoxic radionuclide is linked to either the heavy chains or the light chains, or to all four chains, directly or through a bifunctional chelator. Both heavy chains are chimeric CD4-Ig (immunoglobulin) G2 chains encoded by vector CD4-IgC2HC-PRCCWV (ATCC 75193) and both light chains are chimeric CD4-kappa chains encoded by vector CD4-kLC-PRCCWV (ATCC 75194). CD4 is a non-polymorphic cell surface glycoprotein that is expressed on the surface of helper T lymphocytes, cells of the monocyte/macrophage lineage and dendritic cells. CD4 associates with major histocompatibility complex (MHC) class II molecules on the surface of antigen presenting cells to mediate efficient cellular immune response interactions. In humans, CD4 is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     the target of interaction with the human immunodeficiency virus HIV. The immunoconjugate is used to kill cells infected with HIV, and for treating or preventing infection. It is also used for imaging HIV-infected tissues (for staging or prognosis of infection, and for assessing efficacy of treatments). The immunoconjugate is also used to determine the HIV envelope glycoprotein burden, once determined, this information is used in the staging and prognosis of HIV infected patients. The

The method comprises contacting the HIV with a CD4-IGG2 chimeric heterotetramer to form a complex with the HIV (CD4 = cluster of differentiation 4; IgG2 = immunoglobulin gamma 2). CD4 is a cell surface of differentiation 4; IgG2 = immunoglobulin gamma 2). CD4 is a cell surface of ycoprotein that is expressed primarily on the surface of T cells. In man, CD4 is the target of interaction with HIV. The heterotetramer has two heavy and two light chains which are encoded by expression vectors CD4-IgG2HC-PRCCWV (V1) and CD4-KLC-PRCCWV (V2), respectively. The method is useful to inhibit infection of a CD4+cell by a HIV and to prevent CD4+cells of a subject from becoming infected with HIV. The method is a subject from becoming cD4+cells infected with HIV. The present §equence is human fusion protein: CD4-gamma2 chimeric heavy chain
immunoconjugate should be active against all strains of HIV (since the CD4-gpl20 interaction is essential for infection). The heterotetramers are assembled intracellularly and secreted efficiently from mammalian cells, allowing high recovery and purification from the culture medium. They have longer half-life in serum and greater avidity than heavy chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Inhibiting human immunodeficiency virus (HIV) infection of a CD4+ cell, or treating a subject having CD4+ cells infected with HIV involves using CD4-IgG2 chimeric heterotetramer to form a complex with the HIV -
                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to a combination of an anti-Ep-CAM (cyclic adenosine monophosphate) antibody with a chemotherapeutic agent, that is capable of arresting Ep-CAM antigen expressing cells in the synthesis (5) phase or the second growth phase (M) of cell enlargement (G2)/DNA replication. The antibody exhibits cytostatic activity and is useful in the manufacture of a medicament for use in anti-cancer therapy, characterised in that a chemotherapeutic agent, which is capable of arresting Ep-CAM antigen expressing cells in S or in G2/M, is co-administered to a patient with an anti-Ep-CAM antibody. The combination is useful for treating cancer, particularly colorectal cancer, breast cancer, agentic cancer, prestate cancer or non-small-cell anti-Ep-CAM antibody known as humanised 323/A3 (IgG2cys) which can be used in the combination of the invention.

The present sequence represents the constant region of human igG isotype 2 (IgG2, C-gamma-2). C-gamma-1 (see AAY31669) and C-gamma-3 (see AAY31671) bind Fc receptors with high affinity, whereas C-gamma-4 (see AAY31671) has 10-fold lower binding affinity and C-gamma-2 does not bind to Fc receptor gamma-1. The invention provides methods for the genetic construction and expression of antibody-based fusion proteins with enhanced circulating half-lives. The fusion proteins with enhanced circulating half-lives. The fusion proteins lack the ability to bind to immunoglobulin Fc receptors, either as a consequence of the antibody isotype used for protein construction, i.e. a C-gamma-2 constant region (FC) or a C-gamma-4 Fc receptor, or through directed mutagenesis of antibody isotypes that normally bind Fc receptors, i.e. C-gamma-1 croulating half-life of a non-lumunoglobulin (Ig) protein such as a cytokine, e.g. tumour necrosis factor (INF), an interleukin or a ligand-binding protein, e.g. CD4, CTLA-4, TNF receptor or an interleukin receptor, or a protein toxin (claimed). The fusion proteins are used to deliver selectively the second non-Ig protein can exert a localised biological effect.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antibody-based fusion proteins, used for the delivery of e.g. a cytokine, ligand-binding protein or protein toxin to target cells in

The antibody is directed cytotoxic T-lymphocyte antigen (CTLA)-4. Antibodies of the invention are composed of a heavy chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      variable region, comprising a modified contiguous sequence from a FRI-FR3 sequence encoded by a human VH3-33 family gene. The modifications are contained in CDR1, CDR2 and/or framework regions. The antibodies may be used to inhibit CTLA-4 and down-regulate the immune system to treat hyperimmunity disorders (e.g. autoimmune disease, diabetes and graft rejection) and proliferative disorders (e.g. cancer). CTLA-4 stimulatory agents may be used to up-regulate immune system to up-regulate immunodeficient disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to a combination of an anti-Ep-CAM (cyclic adenosine monophosphate) antibody with a chemotherapeutic agent, that is orabable of arresting Ep-CAM antigon expressing cells in the synthesis (S) phase or the second growth phase (M) of cell enlargement (G2)/DNA replication. The antibody exhibits cytostatic activity and is useful in the manufacture of a medicament for use in anti-cancer therapy, characterised in that a chemotherapeutic agent, which is capable of arresting Ep-CAM antigen expressing cells in S or in G2/M, is co-administered to a patient with an anti-Ep-CAM antibody. The combination is useful for treating cancer, particularly colorectal cancer, breast cancer, gastric cancer, prostate cancer or non-small-cell ung cancer. The present sequence represents the heavy chain of anti-Ep-CAM antibody known as humanised 323/A3 (1gG2cys) which can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Combination for treating cancer (e.g. breast, gastric or prostate cancers), or in the manufacture of a medicament for anti-cancer therapy, comprises an anti-Ep-cyclic adenosine monophosphate antibody with a chemotherapeutic agent
                                                                                                                                                                                                                                                                                                                                                                                          Anti-Ep-CAM antibody, cyclic adenosine monophosphate; cell synthesis; chemotherapeutic agent; cytostatic; anti-cancer therapy; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
